Omphaloplasty based on an isosceles triangle with double fixation in abdominoplasty

Onfaloplastia em triângulo isósceles e com dupla fixação na abdominoplastia

ABSTRACT

Introduction: In conventional abdominoplasty, the creation of a new umbilical scar is challenging. Several surgical techniques and approaches have previously been described and applied, but not always with satisfactory results. The objective is to demonstrate the applicability and satisfaction with omphaloplasty based on an isosceles triangle with double fixation in abdominoplasty. Methods: The study included 97 female patients aged between 25 and 65 years. All underwent classic abdominal dermolipectomy with moderate abdominal liposuction of the entire anterior abdomen and flanks by the same surgeon and were evaluated at 90, 180, and 360 days postoperatively. Results: Patients were satisfied with the umbilicus in most cases (92.8%). Some umbilical scars had contracted (3.1%) and others appeared unsightly (4.1%). No necrosis was observed. Conclusion: This technique was effective and easy to perform, with satisfactory umbilical scar aesthetic outcomes in abdominal dermolipectomy.

INTRODUCTION

Abdominoplasty or abdominal dermolipectomy was described by Kelly in 1899 and is among the most common plastic surgery procedures.

Liposuction combined with abdominal dermolipectomy was described by Avelar in 1998 and has subsequently been accepted as a routine procedure by other authors.

Despite advances in various techniques and adaptations of this procedure, there is still no unanimous agreement on the creation of an umbilical scar, which remains a major challenge in abdominal plastic surgery.

The umbilical scar divides the human body exactly in the middle, according to Marcus Vitruvius, a Roman architect, and this concept was perfected by Leonardo da Vinci in 1490. The evolution of omphaloplasty began in 1924, when Frist performed the first transposition of the umbilicus. Since then, many variations have been used in an attempt to approximate the appearance of the original umbilicus.

In the 1970s, Baroud and Regnaut used horizontal incisions in the abdominal flap, while in 1978, Avelar used a star-shaped incision.

Several techniques have been described: Juri et al. proposed the use of a V-shaped incision, Massiha et al. added a circular umbilical incision and a triangular incision in the abdominal flap, Malic et al. used an inverted U-shaped incision in the flap, and Castillo et al. used Y-shaped de-epithelialized skin flaps.

Several authors have used various geometric shapes (Mercedes star, lozenge, ellipse, cross, rectangle, shield shape, infinity logo, and y-shape) in an attempt to obtain a more natural result in the creation of the umbilicus, but there is still no consensus on the best technique.

OBJECTIVE

To demonstrate the applicability and satisfaction with omphaloplasty based on an isosceles triangle with double fixation in abdominoplasty.
Surgical technique

The abdominal flap was freed using an isosceles triangular incision, with an upper base measuring 2 cm and sides measuring 2.5 cm (Figure 1A and B).

![Figure 1. A: Demarcation of the umbilicus still fixed to the abdominal flap; B: Upper base of the umbilicus measuring 2 cm, with sides measuring 2.5 cm.](image)

The abdominal flap was provisionally fixed in the suprapubic region (Figure 2).

![Figure 2. Provisional fixation of the dermal-fat flap in the pubic area.](image)

The demarcation of the new umbilical implantation site began with a linear, 2-cm horizontal incision in the abdominal flap in place of the original projection of the umbilicus in the skin (Figure 3).

A triangle measuring approximately 0.5 cm was then removed from the middle third of the lower border of this incision (Figure 4 A and B).

Once the skin incision was made at the new umbilical site, the flap fixation site was released to the suprapubic region. This flap was lifted to expose the detachment area and umbilicus. Fixation was performed with 3-0 monofilament nylon between the medial region of the upper edge of the new umbilical incision and the aponeurosis of the rectus abdominis at the upper base of the umbilical pedicle (Figures 5 and 6).

Next, the upper portion of the new umbilical incision was attached with a transcutaneous U-point to the upper portion of the umbilicus (Figure 7), with the knot buried in the umbilicus.

The umbilicus was transferred through the incision in the abdominal flap (Figure 8).

The angles of the umbilical triangle correspond to the angles of the flap incision and are fixed with 4-0 nylon monofilament (Figure 9).

Suturing of the umbilicus at the new site was completed with interrupted U sutures, using 4-0 monofilament nylon with knots buried in the umbilicus (Figure 10).

Finally, the inferior portion of the new umbilical incision was fixed in the abdominal flap to the aponeurosis of the rectus abdominis in the caudal portion of the umbilical pedicle, avoiding displacement of the umbilicus in the postoperative period and minimizing traction on the umbilical scar (Figure 11).
Omphaloplasty based on an isosceles triangle with double fixation in abdominoplasty

The abdominal flap was then pulled up to the suprapubic line for definitive fixation. Silicone umbilical belts were used in all patients.

RESULTS

The 97 patients were followed for up to 12 months after classic abdominal dermolipectomy with omphaloplasty based on an isosceles triangle with double fixation. A questionnaire was used for self-evaluation (Table 1) at 1 year postoperatively. Patients were asked about the degree of satisfaction with the umbilical abdominoplasty scar and whether they would recommend the surgery to a friend; they were also encouraged to write any comments related to the surgery.

In all, 85.5% of the patients were very satisfied with the final outcome of the procedure, 8.2% were satisfied, and 6.1% were slightly satisfied. With respect to the umbilical scar, 82.5% were very satisfied, 10.3% were satisfied, and 7.2% were slightly satisfied.

Only 11 patients commented on the size of the abdominoplasty scar and 18 complained of severe postoperative pain.

The surgeon assessed these 97 abdominoplasty patients at 90, 180, and 360 days postoperatively. At 1 year, the patients were evaluated for umbilical position on the abdomen, type of scar (atrophic, hypertrophic, and contracted), and scar depth; the overall results
were satisfactory, with a low rate of complications (Figures 12, 13, 14, 15).

The complications are listed in Table 2.

DISCUSSION

The degree of satisfaction with abdominoplasty is usually high because of visible postoperative

evaluation was made by the surgeon alone. All other patients reported being satisfied or very satisfied with the umbilical scar.

The 5 patients who would not recommend the surgery to a friend thought that the scar would be smaller, despite being given preoperative information. These 5 were among the 8 who reported only slight satisfaction with the abdominal scar.

Only 11 patients reported expecting a different appearance. Another 18 reported postoperative pain.

CONCLUSION

Omphaloplasty based on an isosceles triangle with double fixation was easy to perform and resulted in a more natural appearance, with overall patient satisfaction.

improvement, compared to the appearance of an abdomen affected by multiparity and fluctuations in body weight.

A poor-quality umbilicus compromises satisfaction with abdominoplasty, and the choice of an appropriate technique is a challenge for the plastic surgeon.

The technique described herein, with abdominal flap fixation to the aponeurosis of the rectus abdominis, superior and inferior to the umbilicus, avoids traction on the umbilical scar, favors the healing process, and promotes a natural appearance, approximating that of an ideal umbilical scar.

The 7 patients who reported poor satisfaction with the umbilical scar underwent a second surgical procedure for correction. This group included 2 patients with an enlarged scar, 2 with a hypertrophic scar, and 3 with scar contraction. Another patient with contraction had an unsatisfactory outcome, but the
